

HackThisSite Basic Exercises 1-11

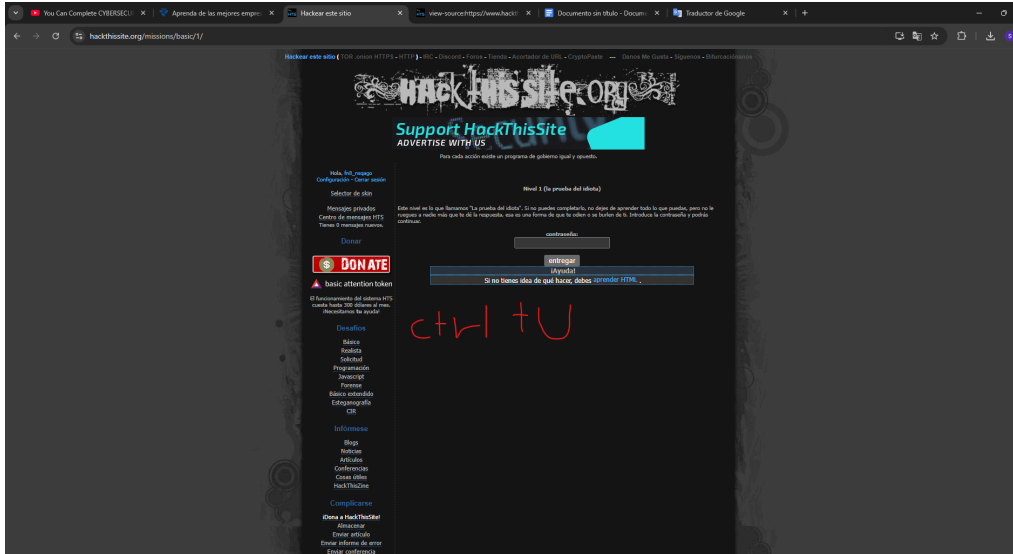

Santiago Peñaranda Mejia

Okay, let's get started with the HackThisSite basic exercises task 1-11.

1. Level 1(the idiot test)

This level is what we call "The Idiot Test", if you can't complete it, don't give up on learning all you can, but, don't go begging to someone else for the answer, thats one way to get you hated/made fun of. Enter the password and you can continue.

The first thing I did was hit Ctrl+U to enter the page code

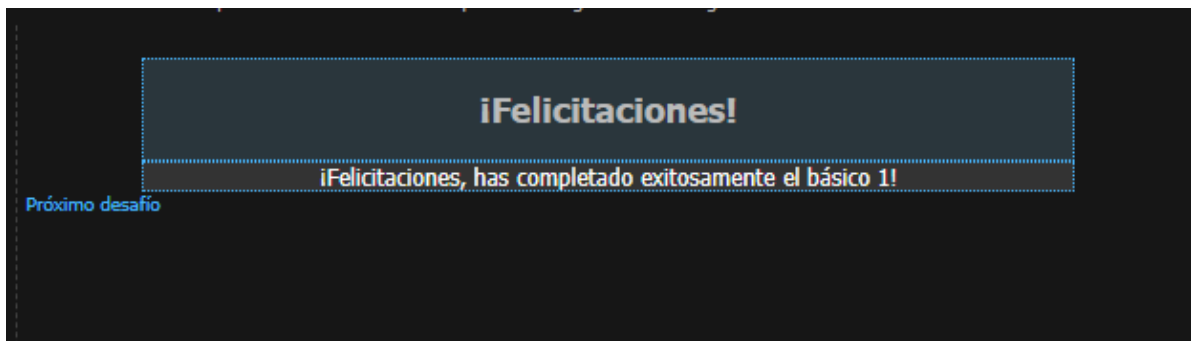

Then what we do is click on the word search engine, this is done by pressing the letter Ctrl + F or searching in the toolbar at the top, and we write the word "password" and that is how it made a filter and we managed to find the corresponding credentials.

```

2. Level 2

Network Security Sam set up a password protection script. He made it load the real password from an unencrypted text file and compare it to the password the user enters. However, he neglected to upload the password file...

This level took me a long time looking for the answer and I couldn't find it, until I realized that if I don't load the text file where the password is, that means it doesn't have a password and I clicked it and by magic it was true and that's how I managed to enter.

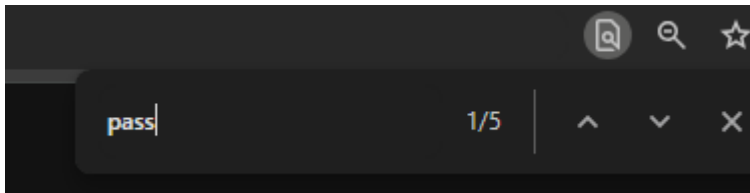

3. Level 3

This time Network Security Sam remembered to upload the password file, but there were deeper problems than that.

Well, first of all, we are going to look at the code of the web page. This is done as I said before with Ctrl+U.

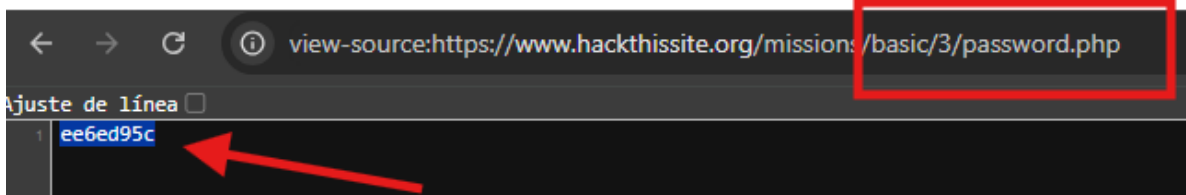

Once here, we are going to filter as I explained before. We do this with the Ctrl+F keys and we will write the word "password."

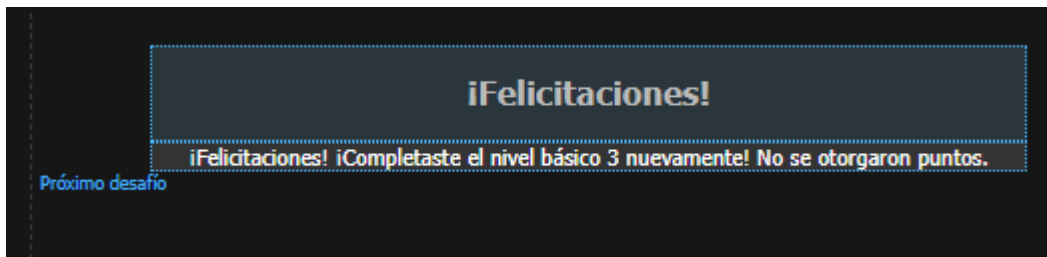

And let's analyze the code to see what we find, as we see here there is a PHP file that says that the value of the username is the file "password.php" so let's take a look at it to see what is in that location

```
<div class="dark-td"><h2>Notice</h2></div><div class="lig
action="/missions/basic/3/index.php" method="post">
type="hidden" name="file" value="password.php" />
type="password" name="password" /><br /><br />
type="submit" value="submit" /></form>
```

And as we can see we have found the credentials in the location of the PHP file called "password"

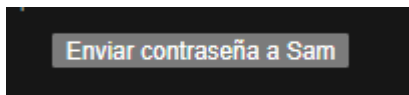

And if this is how we have completed this level

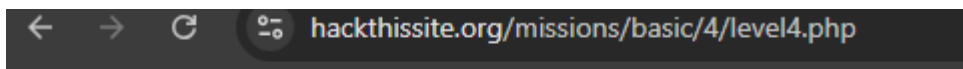

4. Level 4

This time Sam hardcoded the password into the script. However, the password is long and complex, and Sam is often forgetful. So he wrote a script that would email his password to him automatically in case he forgot. Here is the script:

Well, the first thing is to understand what they are telling us. They are telling us that there is a script that will automatically send the password to the email because he forgets it, and we have a button that says "send password to Sam". This means that by pressing the button the password will be automatically sent to Sam's email.

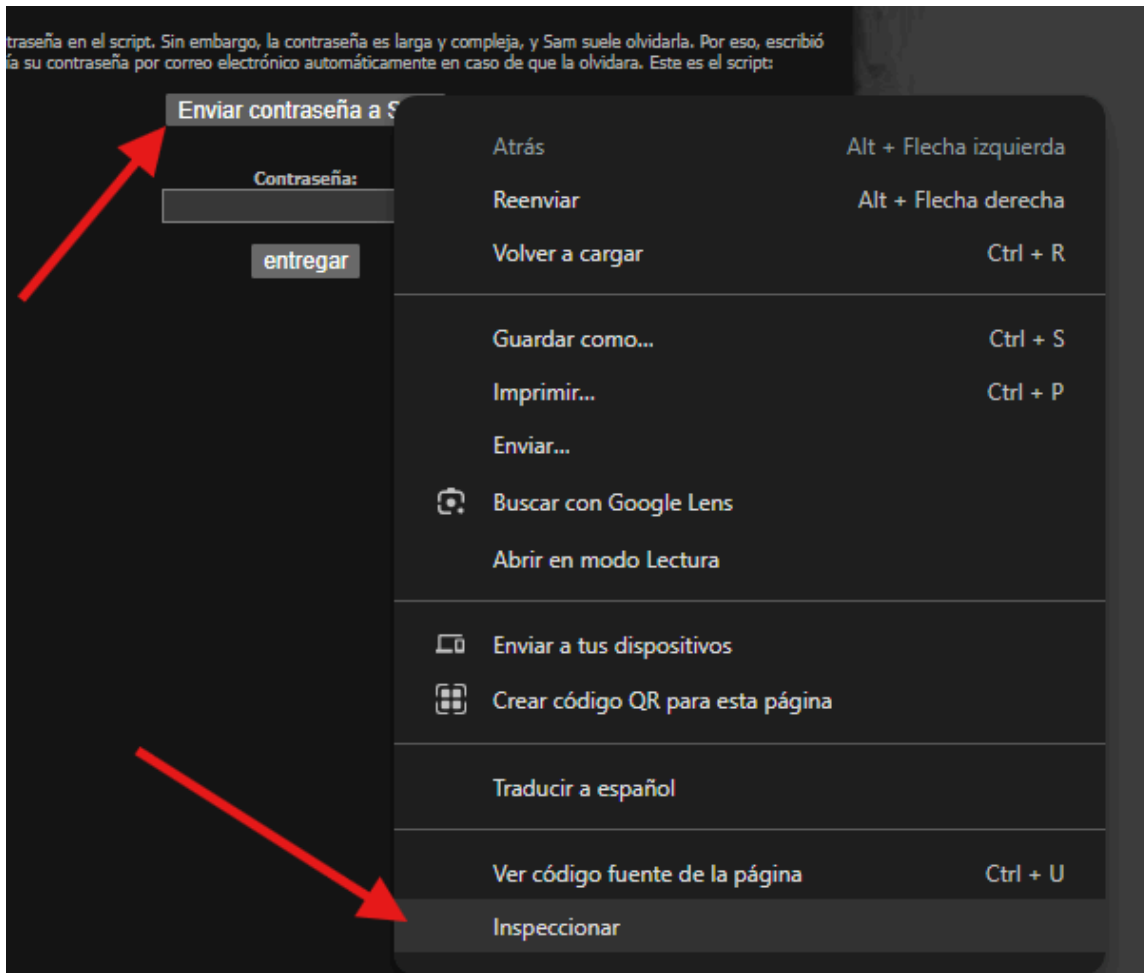

And if you click on it, it tells you that the password has been sent correctly, this means that it was sent.

Password reminder successfully sent.

So what needs to be modified is the email address so that when we give the input it does not send it to us directly, not to SAM.

So let's inspect the Button code to see what script it has that makes it send the email with the credentials automatically.

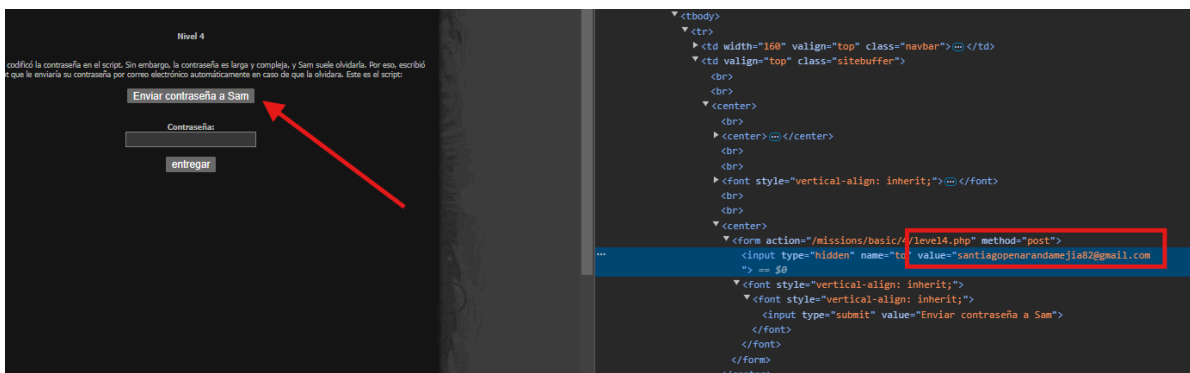

And as we see the button has a script that automatically sends an email to this email address.

```
<br>
  <center>
    <form action="/missions/basic/4/level4.php" method="post">
      <input type="hidden" name="to" value="sam@hackthissite.org">
      <font style="vertical-align: inherit;">
        <font style="vertical-align: inherit;">
          <input type="submit" value="Enviar contraseña a Sam" == $0
```

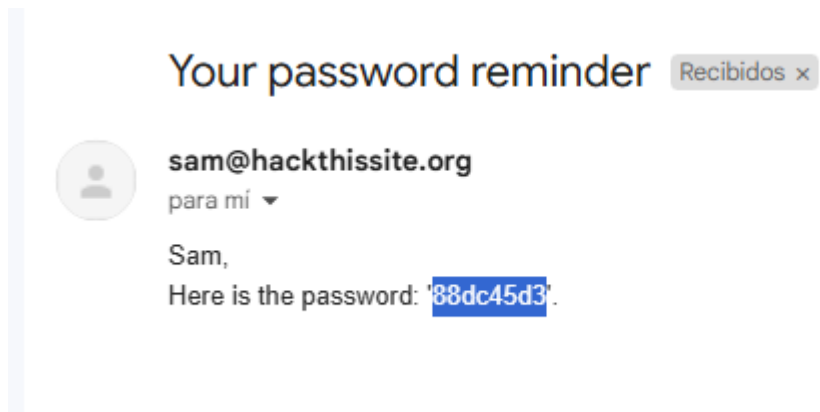

So we are going to modify that address so that it does not send it to us, then what we will do is put our email address where the credentials will be sent to us, in my case I will put this one: "santiagopenarandamejia82@gmail.com"

```
<center>
  <form action="/missions/basic/4/level4.php" method="post">
    <input type="hidden" name="to" value="santiagopenarandamejia82@gmail.com"
    "> == $0
  <font style="vertical-align: inherit;">
    <font style="vertical-align: inherit;">
      <input type="submit" value="Enviar contraseña a Sam">
```

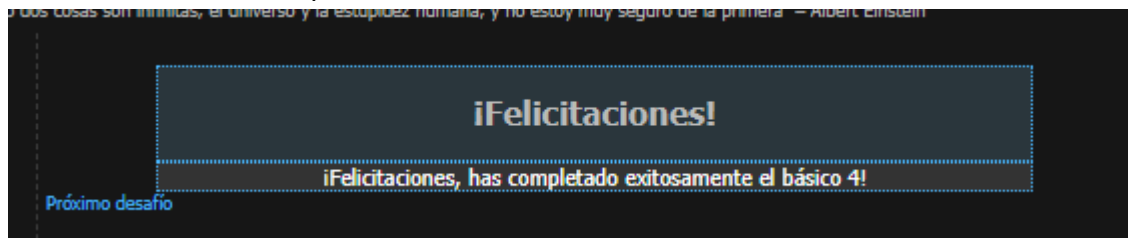

Once we have modified the email address where we will receive the credentials, we will click on the input, that is, the button to send the credentials to our email address.

This is how the credentials will automatically arrive to the email provided.

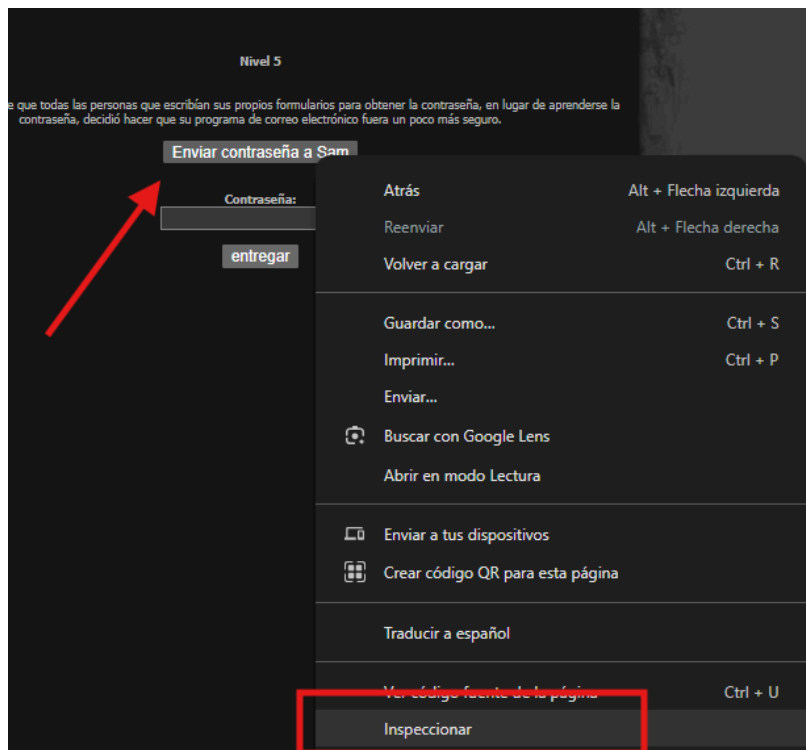

And this is how we completed the level

5. Level 5

Sam has gotten wise to all the people who wrote their own forms to get the password. Rather than actually learn the password, he decided to make his email program a little more secure.

En este vamos a hacer lo mismo que lo del nivel anterior vamos a ir a inspeccionar en el botón que aparece que dice "Eviar contraseña a Sam"

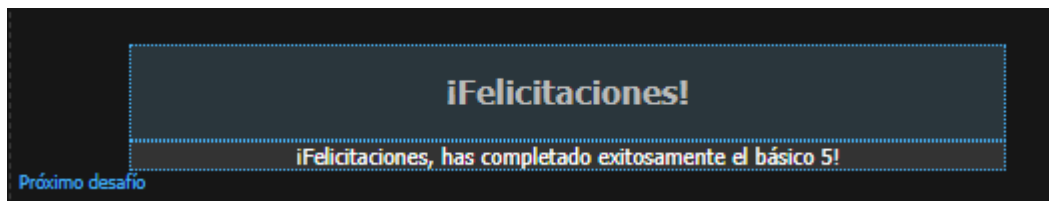

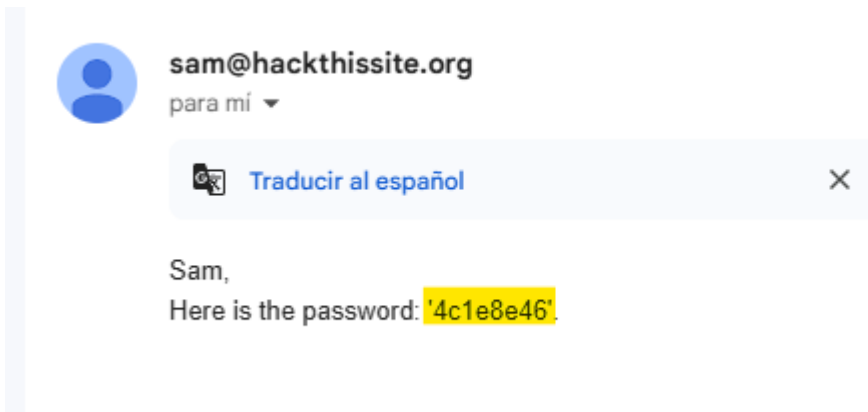

Y vamos a modificar el valor de la variable "value"

```
<center>  
  <form action="/missions/basic/5/level5.php" method="post">  
    <input type="hidden" name="to" value="sam@hackthissite.org">  
    <font style="vertical-align: inherit;">  
      <font style="vertical-align: inherit;">  
        <input type="submit" value="Enviar contraseña a Sam"> == $0
```

Con un correo en el cual nos estará llegando las respectivas credenciales

```
<br>
<br>
<center>
  <form action="/missions/basic/5/level5.php" method="post">
    <input type="hidden" name="to" value="santiagopenarandamejia82@gmail.com"> == $0
    <font style="vertical-align: inherit;">
      <font style="vertical-align: inherit;">
        <input type="submit" value="Enviar contraseña a Sam">
      </font>
    </font>
  </form>
</center>
</div>
```

Y así es como hemos obtenido las credenciales de Sam que aunque haya modificado su programa para ponerlo más seguro podemos ver que sigue siendo poco seguro

6. Level 6

Network Security Sam has encrypted his password. The encryption system is publically available and can be accessed with this form:
